## Ch 8: Introduction to Thermodynamics Worksheet

1. Briefly explain the terms state function and path function as they apply to thermodynamic quantities. Give one example of each.

State functions are independent of the path taken to the current state. An example would be $\Delta H$
Path functions are dependent on the history/path taken to current state. Example is work.
2. What is Hess' Law? What property does Hess' Law depend on?
$\Delta H_{\text {reaction }}=\sum \Delta H_{\text {f product }}-\sum \Delta H_{\text {freactant }}$

Dependent on $\Delta H$ being a state function, so it doesn't matter what path the compounds took to create its products
3. The standard molar enthalpy of formation, $\Delta H_{f}^{o}$, for diborane, $B_{2} H_{6}$, cannot be found directly because the compound cannot be prepared by the reaction of boron and hydrogen. However, it can be calculated using the following reactions:

$$
\begin{aligned}
& 4 \mathrm{~B}_{(\mathrm{s})}+3 \mathrm{O}_{2(\mathrm{~g})} \rightarrow 2 \mathrm{~B}_{2} \mathrm{O}_{3(\mathrm{~s})} \\
& 2 \mathrm{H}_{2(\mathrm{~g})}+\mathrm{O}_{2(\mathrm{~g})} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} \\
& B_{2} \mathrm{H}_{6(\mathrm{~g})}+3 \mathrm{O}_{2(\mathrm{~g})} \rightarrow B_{2} \mathrm{O}_{3(\mathrm{~s})}+3 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}
\end{aligned}
$$

$$
\Delta H_{r x n}^{o}=-2543.8 \mathrm{~kJ}
$$

$$
\Delta H_{r x n}^{o}=-484 . \mathrm{kJ}
$$

$\Delta H_{r x n}^{o}=-2032.9 \mathrm{~kJ}$ +35.0kJ
4. Calculate $\Delta H_{r x n}^{o}$ for $\mathrm{CH}_{4(\mathrm{~g})}+2 \mathrm{O}_{2(\mathrm{~g})} \rightarrow \mathrm{CO}_{2(\mathrm{~g})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})}$ given that:
$\Delta H_{f}^{o} C H_{4(\mathrm{~g})}=-74.8 \mathrm{~kJ} / \mathrm{mol}$
$\Delta H_{f}^{o} \quad C_{2(g)}=-393.5 \mathrm{~kJ} / \mathrm{mol}$
$\Delta H_{f}^{o} \quad H_{2} O_{(l)}=-285.8 \mathrm{~kJ} / \mathrm{mol}$
-890. kJ/mol
5. Given the following bond enthalpies:

$$
\begin{aligned}
\Delta H_{B}[H-H] & =436 \mathrm{~kJ} / \mathrm{mol} \\
\Delta H_{B}[O-O] & =157 \mathrm{~kJ} / \mathrm{mol} \\
\Delta H_{B}[O-O] & =496 \mathrm{~kJ} / \mathrm{mol} \\
\Delta H_{B}[O-H] & =463 \mathrm{~kJ} / \mathrm{mol}
\end{aligned}
$$

What is the reaction enthalpy for $\mathrm{H}_{2} \mathrm{O}_{2} \rightarrow 1 / 2 \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O}$ ?
-91kJ/mol
6. Given: $2 \mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}$

$$
\Delta H=-572 \mathrm{~kJ}
$$

$$
\mathrm{N}_{2} \mathrm{O}_{5}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{HNO}_{3}
$$

$$
\Delta H=-77 \mathrm{~kJ}
$$

$$
1 / 2 \mathrm{~N}_{2}+11 / 2 \mathrm{O}_{2}+1 / 2 \mathrm{H}_{2} \rightarrow \mathrm{HNO}_{3}
$$

$$
\Delta H=-174.2 \mathrm{~kJ}
$$

Calculate the change in enthalpy of the reaction $2 \mathrm{~N}_{2}+5 \mathrm{O}_{2} \rightarrow 2 \mathrm{~N}_{2} \mathrm{O}_{5}$
+29kJ
7. What mass of propane, $\mathrm{C}_{3} \mathrm{H}_{8(\mathrm{~g})}$ must be burned to supply 2580. kJ of heat? The standard enthalpy of combustion of propane at 298 K is $-2220 . \mathrm{kJ} / \mathrm{mol}$.
51.14 g
